What is an adjuvanted vaccine?

An **adjuvanted vaccine** combines both an **antigen** and an **adjuvant**

- **Antigen**: stimulates an immune response and produces antibodies
- **Adjuvant**: can be added to the vaccine to boost this immune response

These antiboies help protect the person from the infection.

This is particularly important during a pandemic as more vaccine doses can be available to protect more people around the world.

Which means less antigen is needed.

What is an adjuvanted vaccine?

An **adjuvanted vaccine** combines both an **antigen** and an **adjuvant**.
